

Realistic Car Controller Pro

Thank you for purchasing and using Realistic Car Controller Pro. This documentation will guide you on how the telemetry and input messages works.

Enabling / Disabling Telemetry

Telemetry can be toggled on or off from the [RCCP Settings](#) ([Tools](#) → [BCG](#) → [RCCP](#) → [Edit Settings](#)). When you enabled the telemetry, [RCCP_SceneManager](#) will instantiate the telemetry in your scene. [RCCP_Telemetry](#) script attached to the telemetry canvas will read specific values of the player vehicle. Use it for test only.

Enabling / Disabling Input Messages

Input messages can be toggled on or off from the [RCCP Settings](#) ([Tools](#) → [BCG](#) → [RCCP](#) → [Edit Settings](#)). Use it for test only.

Common Mistakes

- Don't drag and drop the RCCP_Telemetry prefab to your scene. If your option in RCCP Settings is disabled, telemetry will disable itself. Only enable it in RCCP Settings.
- Don't leave telemetry and input messages on while releasing your game.
